PROBLEM–SOLUTION FIT CANVAS

Global Fuel Prices and Taxation Trends | Joyal Sengar | EN25CS3010450

Purpose / Vision: Give fuel-market analysts a clear Tableau view of fuel prices and taxation patterns for faster, evidence-based comparisons.

1. CUSTOMER SEGMENT(S)
Who is your customer?
- Energy-market analysts comparing fuel prices across countries and regions.
- Government and energy-policy researchers studying taxation and subsidies.
- Students or decision-makers preparing market summaries.

6. CUSTOMER CONSTRAINTS
What limits the user?
- Many countries, dates and fuel measures are difficult to compare in raw tables.
- Tax, subsidy and crude-price definitions may need source context.
- Unusually low values may reduce confidence in results.
- Manual analysis takes time.

5. AVAILABLE SOLUTIONS
What alternatives exist?
- Spreadsheet review: familiar but often manual.
- Static reports: useful but may be fragmented or outdated.
- Tableau worksheets, dashboard and story: organize comparisons in one workflow.

2. JOBS-TO-BE-DONE / PROBLEMS
What does the user need to do?
- Compare petrol, diesel and LPG prices across countries and regions.
- Compare tax percentages by region and income level.
- Explore changes over time alongside the available Brent crude measure.
- Compare prices by income and subsidy categories.

9. PROBLEM ROOT CAUSE
Why does the problem exist?
- Records span many countries, regions and dates.
- Different fuel types and tax measures need consistent aggregation.
- Raw tables do not reveal multi-dimensional patterns easily.
- Very low price values should be validated.

7. BEHAVIOUR
What does the user currently do?
- Scans datasets and spreadsheet summaries.
- Compares selected countries, regions and fuel types.
- Looks for tax and price differences across categories.
- Uses charts or reports to explain trends.

3. TRIGGERS
What prompts the user to act?
- Need to explain regional fuel-price differences.
- Request to compare taxation patterns.
- Report or presentation requires clear fuel-market visuals.
- Interest in patterns by time, income or subsidy level.

10. YOUR SOLUTION
How does your project respond?
- Use the global fuel CSV as the data source.
- Prepare and validate fields before interpretation.
- Create Tableau worksheets for price, tax, region, time, income and subsidy comparisons.
- Combine views in a dashboard and data story.

8. CHANNELS OF BEHAVIOUR
How does the user access information?
ONLINE
- Opens the packaged .twbx workbook in Tableau Desktop.
- Reviews worksheets, dashboard and story.

OFFLINE
- Discusses exported views in a class or review meeting.
- Shares written findings and data-quality caveats.

4. EMOTIONS: BEFORE / AFTER
How does the user feel?
BEFORE: Overwhelmed by many records and uncertain which comparisons matter.

AFTER: Better able to explore patterns visually and explain findings, while remaining cautious about limitations.

PROJECT FIT SUMMARY
The Tableau dashboard and story organize the supplied data into regional, time-based and category comparisons. They help users explore patterns but do not prove taxation or subsidies cause price differences.

Note: These are analytical user personas, not findings from formal interviews.
