PROJECT DESIGN PHASE-I

Problem – Solution Fit Template

Project Detail	Information
Date	29 October 2026
Team ID / Enrollment No.	EN25CS3010450
Project Name	Global Fuel Prices and Taxation Trends
Maximum Marks	2 Marks
Student	Joyal Sengar (Individual Project)

Problem – Solution Fit Template:

Problem–solution fit means identifying a user problem and shaping a solution that addresses that problem. For this Tableau project, the canvas links the needs of people analyzing global fuel prices and taxation to the data preparation, visual analysis, dashboard and story.

Purpose:

- Solve analytical problems in a way that fits the needs of the intended users.
- Help users compare fuel-price and taxation patterns more efficiently.
- Improve communication by presenting findings through clear visual summaries.
- Understand the current analytical challenges and how the Tableau solution may address them.

PROBLEM–SOLUTION FIT CANVAS

Project: Global Fuel Prices and Taxation Trends | Student: Joyal Sengar | EN25CS3010450

1. CUSTOMER SEGMENT(S) **Who is the user?** • Energy-market analysts comparing fuel prices across countries and regions. • Government or energy-policy researchers examining taxation and subsidies. • Students or decision-makers who need a clear overview of global fuel-price patterns.	**2. CUSTOMER CONSTRAINTS** **What may limit the user?** • Large numbers of countries, dates and measures can be difficult to compare in raw tables. • Definitions and units for tax, subsidy and Brent crude measures may need source documentation. • Unusual or very low price values may affect confidence in the analysis.	**3. AVAILABLE SOLUTIONS** **What alternatives exist?** • Review the original CSV in a spreadsheet. • Compare countries using separate tables or charts. • Use the Tableau workbook's worksheets, dashboard and story to view multiple comparisons in one analytical workflow.
4. JOBS-TO-BE-DONE / PROBLEMS **What is the user trying to do?** • Identify higher- and lower-price regions for petrol, diesel and LPG. • Compare tax percentages by region and income category. • Explore time-based patterns and differences by income and subsidy level. • Communicate findings in a clear, evidence-based way.	**5. PROBLEM ROOT CAUSE** **Why is the problem happening?** • The dataset contains repeated records across countries, regions and dates. • Fuel prices and tax percentages need aggregation and consistent comparison. • Raw values alone do not readily show patterns across several dimensions.	**6. BEHAVIOUR** **What does the user currently do?** • Scans records and compares selected countries, regions and measures. • Looks for trends across dates and category groups. • Checks chart labels and summaries to interpret patterns. • Needs to distinguish observed association from cause and effect.
7. TRIGGERS **What makes the user seek a solution?** • A need to explain why recorded fuel prices differ across regions. • A request to summarize tax-percentage patterns. • A need to present fuel-price trends or category comparisons in a report or discussion.	**8. YOUR SOLUTION** **How does the project address the problem?** • Prepare and validate the global fuel CSV for analysis. • Use Tableau worksheets to compare fuel prices, taxation and category patterns. • Combine relevant views in a dashboard and data story. • Present clear labels, measures and limitations alongside the findings.	**9. CHANNELS OF BEHAVIOUR** **How does the user access the solution?** • Opens the packaged Tableau workbook (.twbx) in Tableau Desktop. • Reviews the worksheets, dashboard and story included in the workbook. • Uses only the filters, tooltips or interactions that are actually configured in the final workbook.

10. BEFORE / AFTER **What changes for the user?** BEFORE: Comparisons require manually reviewing many records and measures; patterns may be difficult to communicate. AFTER: Tableau views organize the available data into visual comparisons, helping the user explore regional, tax and time-based patterns more clearly.	**Project fit summary** The proposed Tableau solution organizes the supplied fuel dataset into comparable visual views. It supports exploration and communication of patterns but does not, by itself, prove that tax or subsidy levels cause price differences. **Note:** User profiles are analytical personas based on the project scope, not findings from formal customer interviews.
