Project Proposal (Proposed Solution)

Project Detail	Information
Date	29 October 2026
Team ID / Enrollment No.	EN25CS3010450
Project Title	Global Fuel Prices and Taxation Trends
Project Type	Individual Project
Maximum Marks	3 Marks

Project Proposal (Proposed Solution) Template

This project proposal outlines a Tableau-based analytical solution for comparing global fuel prices and taxation patterns. It defines the objective, scope, problem statement, proposed approach, key features and resources required to prepare, analyze and communicate insights from the available dataset.

Project Overview

Area	Description
Objective	To create an interactive Tableau dashboard and data story that provide a clear, data-driven view of petrol, diesel and LPG prices, taxation percentages, regional differences and available time-based patterns, helping users compare fuel-market information and communicate findings more effectively.
Scope	Analyze the available global fuel dataset using fields such as date, country, region, petrol price, diesel price, LPG price, Brent crude price, tax percentage, income level and subsidy level. Prepare the data, build Tableau worksheets, combine relevant visualizations into a dashboard and story, and summarize key observations. The project focuses on descriptive analysis of the supplied data; real-time feeds, price forecasting and causal policy evaluation are out of scope.
Problem Statement — Description	Global fuel-price and taxation records span multiple countries, regions, dates and fuel categories. Reviewing these records in raw tables can make it difficult to compare petrol, diesel and LPG prices, identify differences in taxation, and explore how patterns vary by region, income level, subsidy category or time. A consolidated visual analysis is needed to make these comparisons easier to explore and explain.
Problem Statement — Impact	A well-organized Tableau dashboard can reduce the effort required to compare records, make category-level and time-based patterns easier to identify, and support clearer communication of findings. The analysis can inform further investigation and discussion, but it cannot by itself prove that taxation or subsidies cause fuel-price differences.

Proposed Solution

Area	Description
Approach	Connect Tableau to the supplied fuel-price CSV dataset; inspect and prepare field types, dates, categories and data quality; review missing, duplicate and unusual values; create suitable aggregations or calculated fields; build worksheets for the project's main analytical questions; then combine the selected views into a dashboard and Tableau story. Validate chart labels, units and calculations against the source data before final export.
Key Features	• Compare petrol, diesel and LPG price measures. • Explore fuel-price differences by country and region. • Examine tax percentages across available categories, including region and income level. • Review trends over time and compare them with the available Brent crude price measure. • Compare results across income and subsidy levels. • Present selected visualizations in a consolidated Tableau dashboard and data story. • Use clear titles, labels, legends and appropriate filters/interactions where included in the final workbook.

Resource Requirements

Resource Type	Description	Specification / Allocation
Hardware — Computing	Device to prepare the dataset and run Tableau Desktop.	A Windows laptop or desktop capable of running the installed Tableau version; a modern multi-core processor is recommended.
Hardware — Memory	RAM for opening the dataset and working with multiple worksheets.	8 GB RAM minimum recommended; more memory can help with larger datasets.
Hardware — Storage	Space for the source dataset, Tableau workbook and exported files.	Keep sufficient free disk space for the CSV, packaged workbook (.twbx), and PDF/image exports.
Software — BI Tool	Tool for data preparation, visualization, dashboard creation and storytelling.	Tableau Desktop; Tableau Public only if online publishing is chosen and configured.
Software — Supporting Tools	Tools to inspect the source file and document the project.	Microsoft Excel or another spreadsheet viewer; PDF reader and word processor for documentation.
Data — Source	Input data and its format.	Global fuel prices dataset supplied for the project, in CSV/spreadsheet format, containing available fuel prices, tax, date, location, income and subsidy fields.

Implementation note: This proposal describes the intended Tableau analytics workflow. Exact chart names, filters, calculations and final findings should match the submitted workbook and actual source data. No unverified KPI values or forecasting features are assumed.
