Define the Problem Statements

Project Detail	Information
Date	29 October 2026
Team ID / Enrollment No.	EN25CS3010450
Project Name	Global Fuel Prices and Taxation Trends
Maximum Marks	2 Marks
Student	Joyal Sengar (Individual Project)

Customer Problem Statement Template:

A customer problem statement helps identify who needs the analysis, what they are trying to understand, what prevents them from doing so, why the barrier exists, and how it affects their decisions. The statements below are tailored to the global fuel prices and taxation dataset and Tableau analysis.

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	A fuel policy analyst comparing fuel prices across countries and regions.	Understand which regions and countries have higher or lower petrol, diesel and LPG prices.	Fuel-price information across locations can be difficult to compare quickly in one view.	The measures need to be reviewed across multiple countries, regions and fuel types, and differences may be obscured in raw tables.	Unsure about the overall pattern and less confident when explaining regional differences.
PS-2	A government or energy-policy researcher examining fuel taxation.	Understand how tax percentages vary across regions and income-level categories, and how they relate to fuel prices.	It is difficult to spot category-level differences and possible relationships from raw data alone.	Tax values and fuel prices must be compared across many records and categories, which is easier to interpret through consistent visual summaries.	Concerned that important differences may be missed when preparing evidence-based analysis.
PS-3	An energy-market analyst studying fuel-price changes over time.	Explore changes in petrol, diesel and LPG prices alongside the available Brent crude price measure.	The time-based patterns and differences between fuel measures may not be immediately obvious.	The data contains repeated observations across dates, locations and categories, so trends require filtering and visualization.	Frustrated by the effort required to find clear trends and cautious about drawing conclusions without a consolidated view.

Overall problem statement: Users analyzing global fuel markets need a clear and interactive way to compare fuel prices across countries and regions, review taxation patterns, and explore changes over time. Without organized visual comparisons, it can be difficult to identify meaningful patterns in the data and communicate findings clearly.

Proposed analytical response: Use Tableau worksheets, a dashboard and a data story to present fuel-price comparisons, tax-percentage patterns, category differences and time-based trends supported by the available dataset.

Note: These are analytical user profiles created for the project, not interviews with actual customers. The statements describe plausible analysis needs based on the dataset fields.
