Empathize & Discover

Project Detail	Information
Date	29 October 2026
Team ID / Enrollment No.	EN25CS3010450
Project Name	Global Fuel Prices and Taxation Trends
Maximum Marks	4 Marks
Student	Joyal Sengar (Individual Project)

Empathy Map Canvas:

An empathy map helps describe a likely user's perspective, including what the user says, thinks, does and feels. The canvas below is tailored to the needs of people exploring global fuel prices and taxation through the supplied dataset and Tableau dashboard.

Primary user persona: Energy Market Analyst

The persona is a representative analytical user created for this project, not a real person interviewed by the student.

SAYS	THINKS
• Which regions have the highest and lowest petrol, diesel and LPG prices? • How do tax percentages differ between regions and income groups? • Can I compare fuel-price trends over time in one place?	• Are price differences consistent across fuel types? • Do tax percentages appear to move with retail fuel prices? • How might income and subsidy categories relate to observed differences? • I need clear visuals to avoid misreading large tables.

DOES	FEELS
• Compares fuel-price measures across countries and regions. • Reviews tax percentage by region and income level. • Uses date-based charts to inspect changes over time. • Filters dashboard views to focus on categories of interest.	• Frustrated when data is difficult to compare in raw tables. • Cautious about drawing conclusions without clear evidence. • More confident when charts are consistent, labelled and interactive. • Interested in findings that can be communicated clearly.

User goals and challenges

Goals	Challenges / barriers
• Compare fuel prices across locations. • Understand differences in taxation categories. • Explore changes over time and potential associations. • Communicate findings through a clear dashboard and data story.	• Many countries, dates and measures need comparison. • Very low or unusual values may affect interpretation. • Tax and subsidy definitions may require source context. • Correlation between two measures does not prove causation.

How the Tableau project responds: The dashboard and story bring fuel-price measures, tax percentage, region, date, income level and subsidy level into visual views that support comparison and exploration.

Note: This empathy map is a project-based persona inferred from the analysis task and available dataset fields; it should not be presented as evidence from actual customer interviews.
